Assessor pack - running a ChronoMap evaluation session

For the team member running a session. Covers both techniques: the in-person **think-aloud** (participants P1-P5) and the remote **questionnaire** (participants Q1-Q5).

Do not give this file to a participant. Hand them `pack-tester.md` instead - it deliberately leaves out the success criteria so they are not led to the answer.

The underlying decisions and the full instrument live in `study-kit.md`. This pack is the practical run-sheet; where the two disagree, the study kit wins.

Before you start (once, ~15 minutes)

- [ ] Open the Figma prototype on the test phone and run the whole journey end to end.
- [ ] Attempt all five tasks yourself. Note the exact tap path for each - you need to know the

intended route to recognise when someone has gone off it.

- [ ] Fix any dead link **now**. A broken link discovered mid-session wastes a participant you

cannot replace.

- [ ] Print or open: the task cards (`pack-tester.md`), this pack, and a blank notes template

(`study-kit.md` §8) per participant.

- [ ] Agree who moderates and who takes notes. **Two people.** One person cannot do both well.

Part 1 - Think-aloud sessions (P1-P5, in person, ~25 min each)

Timing

Stage	Time	What happens
Welcome and consent	2 min	Explain, ask about audio recording, record their answer
Context briefing	1 min	Read the briefing aloud, word for word
Warm-up	1 min	"Open the app and tell me what you think it is for"
Tasks	15 min	Five tasks, one at a time, ~3 min each
Debrief	3 min	Four questions
Wrap	2 min	Thanks, note the end time

The four rules

1. **Do not help.** Let them struggle. Struggling is the data.
2. **If they go quiet for 10 seconds**, prompt: "*What are you thinking?*" or *"What do you expect

that to do?" *Never* "Have you tried the button at the top?"*

1. **If they are stuck for 60 seconds**, give the smallest possible hint, write it down as an

assist, and move on. A task completed after an assist is scored P, not C.

1. **Never explain why something is designed the way it is.** If they ask, say *"I'll explain

after we finish - what would you expect it to do?"* Defending the design mid-session contaminates everything after it.

Scoring each task

Code	Meaning
C	Completed with no help and no wrong turns
P	Completed, but needed an assist or went the wrong way first
F	Not completed, or abandoned at 5 minutes

Stop a task at 5 minutes and record F. Do not let one task eat the session.

Success criteria - what counts as done

Keep these to yourself during the session.

Task	Counts as complete when they…
T1	Reach the rally screen for the clock tower session
T2	Can say which position they have and where it is, **and** use a one-tap reply rather than the mic
T3	Use a quick reply to respond, **and** correctly name the side that still needs photos
T4	Reach the share screen with exact location off and a story format selected
T5	Open the participant menu and flag the person

T2 and T3 are the ones to watch. They are the tasks that test whether the coordination design actually works, and they are where the host/radar concept either proves itself or does not.

Debrief questions

Ask all four, in this order, and write the answers verbatim:

1. What was the most confusing moment?
2. Would you join a session like this with people you do not know? Why or why not?

3. Would you use the voice channel, or the quick replies?
4. Anything you would change?

Immediately after - before the next participant

Write down **your top three problems from this session** while it is fresh. Five sessions blur together fast, and a problem you cannot remember at analysis time may as well not have happened.

Part 2 - Questionnaire (Q1-Q5, remote, ~15 min each)

These must be **five different people** from the think-aloud five. The handout requires ten participants, five per technique.

Sending it out

Send three things together:

1. The prototype link (the shareable Figma link, verified it opens when logged out).
2. The tester pack - the context briefing and the five tasks.
3. The form link.

Ask them to do the tasks alone, in order, and fill the form **straight afterwards** while it is fresh. Ask them to note roughly how long the tasks took.

Building the form

Google Forms is fine. Four parts, in this order - the full item list is in `study-kit.md` §7:

Part	Contents	Scale
A	The ten standard System Usability Scale statements	1-5, strongly disagree to strongly agree
B	Six ChronoMap items (C1-C6): purpose, joining strangers, voice comfort, radar clarity, privacy trust, motivation	same 1-5
C	Two open questions (O1, O2)	free text
D	Participant code, device used, rough time taken, any task not completed	short answer

Add the participant code field as the **first** question, not the last - people abandon forms at the end, and a response you cannot attribute is hard to use.

Scoring the usability scale

For the odd-numbered statements, subtract 1 from the rating. For the even-numbered ones, subtract the rating from 5. Add the ten results and multiply by 2.5. That gives a score from 0 to 100.

Report the mean, the spread, and the per-item means across your five participants. Around 68 is the published average - treat it as a point of reference, not a pass mark, and do not claim statistical significance from five people.

Common mistakes

- **Moderating and note-taking alone.** You will do both badly and lose the quotes.
- **Helping too early.** The instinct to rescue someone is strong. Sixty seconds is longer than it

feels; count it.

- **Interpreting during the session.** Write what happened, not what it means. Interpretation is

Saturday's job, done as a group.

- **Paraphrasing quotes.** Verbatim or not at all. A real sentence in the report is worth more than

a tidy summary.

- **Letting the participant think they are being tested.** Say it twice if you need to: we are

testing the design, not them.

- **Skipping the warm-up.** Whether someone understands the purpose before they tap anything is

itself a finding, and you only get one chance per person to observe it.

If something goes wrong

Problem	What to do
A link is dead mid-session	Note the screen number, say "*that one isn't wired up - let's move on*", continue. Record it as a finding.
They ask whether they did it right	"*There's no right answer - I'm interested in what you expected.*"
They refuse audio recording	Fine. Take written notes only. Record the refusal on the notes sheet.
They finish very early	Use the optional sixth task in `study-kit.md` §5, or go deeper in the debrief.
They want to talk about the idea, not the interface	Let them - briefly. Willingness to join strangers is one of the things you are trying to learn. Then steer back.

Where it all ends up

Everything recorded here flows into `findings-log.md` on Saturday, and from there into report §3.4 and §3.5. Both are already scaffolded and waiting on this data.
