Assignment 3, 2026

Set: 21st September

Video demo submission: **11:59pm, 18th October**

Final electronic submission: **11:59pm, 2nd November**

Individual moderated interactive oral assessment: **Examination period**

This assignment counts towards **55%** of the marks for this subject

This assignment should be completed **in groups of 3 or 4 people.**

Aim

The purpose of this assignment is to get you to continue improving the social system designed in Assignment 2, with particular focus on evaluation, and the development of a high-fidelity and functional prototype.

Task

Your task is to design, prototype and evaluate the user interface of the system proposed in Assignment 2. This assignment will consist of these main steps:

High-fidelity Functional Prototype

You must also deliver a high-fidelity and functional prototype of your system that contains all the possible interactions, and use Figma. This prototype should be improved based on data gathered from the evaluation. This is only a prototype of the interface, not a fully functional system (no need for a backend).

Demo

A 3-minute video demo (uploaded to Youtube) where you should explain your system and demo its functionality. Note, that at this stage you do not need to have implemented all the features, but should be able to provide an overview of your system. You can set the video to unlisted if you wish to prevent it from being viewed publicly, but please ensure that we can access it from the provided link without requiring any special permissions.

Evaluation

Use at least one querying and one observation technique to evaluate your high-fidelity prototype with a minimum of 10 participants (5 participants per technique). Make improvements to your high-fidelity prototype based on lessons learned from this evaluation.

The assignment will be assessed on:

- Overall quality of the report
- Appropriateness of the user interface and functionality for the design space and purpose of the system
- Appropriate use of methods and techniques in the design and evaluation of the system
- Effectiveness of the demo in conveying the functionality of the system and how it supports social behaviour
- Complexity and creativity of the system
- An individual moderated interactive oral assessment.

Electronic submission, Report Format, AI Usage

You will need to submit your assignment via Canvas by the due date. Your report should be submitted as a PDF, and should have 3000 to 5000 words + images of all your initial prototypes. In addition, you need to submit a Figma link to the final high-fidelity functional prototype of your system. Note: only one member of your group needs to make a submission to Canvas.

The report should include the following information:

- **Title page:** Should include the name of your system, and the names of the group members. It should also have a link to the Figma project and a link to the created demo video (YouTube).
- **Introduction:** Introduce your system, explaining what is its main purpose.
- **Methods:** What methods did you use, such as for brainstorming, ideating, designing, and user evaluation? Why? Provide a thorough description of the evaluation techniques you used.
- **Results (Prototypes & Evaluation Findings):** Present your prototypes and how they evolved over time based on the evaluation to arrive at the final functional prototype. Ensure that you explain in detail the different features and how they support social behaviours, and make sure to justify the different design decisions that you made.
    - Make sure to explain design decisions and functionality, and how the user evaluation results influenced/changed your system design.
- **Discussion:** Is your final prototype usable? What is it good for, what are its problems? What would you change if you had more time? How does it compare to similar systems in the market?
- **Contribution:** Please use FeedbackFruits for peer assessment, to rate yours as well as your teammates' contributions towards the project. FeedbackFruits is linked in Canvas.

Plagiarism and AI Use:

Remember that copying text verbatim from the Internet or from your colleagues will be considered cheating. We will be checking for similarity between submissions and with text available over the Internet. We will also be checking for text generated via AI tools.

AI Use Statement:

Please submit an 'AI Use Statement' irrespective of whether you used AI tools for this assignment.

- Answer the question: "Did you use artificial intelligence software such as ChatGPT, QuillBot or DALL·E in completing this assessment?"
    - If no, state this, and include this answer in your report.
    - If yes, state this, and you must also include in the report:
        - Explanation of how you used the AI tool(s), how you incorporated the output into your assignment, and why (50-300 words).
        - Logs of your interactions with the tool, including your prompts and the outputs. For example, ChatGPT allows you to export chat logs through a shareable link.

Delays

Make sure you deliver your work on time using Canvas. Overdue delivery will result in a reduction of 10% of the marks (5.5 points out of 55) for each day of delay.
