Worked samples - what a filled-in session and response look like

> ## ⚠️ THIS IS INVENTED DATA
>
> Nothing on this page came from a real participant. It exists only to show the team what a completed sheet looks like, so the first real session is not also the first time anyone has seen the form filled in.
>
> **None of this may be copied into the report, the findings log, or anything submitted.** Fabricated evaluation data in an academic submission is academic misconduct, and this one is
> worth 55% of the subject. Delete this file before submission if there is any chance of confusion.

Sample A - think-aloud session notes (in person)

```
Participant: PT-1        Date/time: Fri 30 Oct, 2:10pm      Moderator: Yong En   Note
Background: Masters student, not in INFO90007      3D-scan apps used before: no
Device: phone (own, iPhone)    Audio consent: yes     Recording file: p1-301025.m4a
```

Warm-up - what they said the app is for:

> "Taking photos of a building with other people? I think it makes like a 3D version of it. I'm not sure why you'd need other people though, can't you just walk around it yourself?"

(Noted: purpose partly understood, but the reason for needing a group was not.)

Task	Outcome	Time	Assists	Errors / wrong taps	Quotes (verbatim)	Observed problem + screen
T1	**C**	0:40	0	-	"Oh there it is, live now."	-
T2	**P**	3:10	1	Tapped the mic icon twice before finding the quick replies	"How do I tell them without talking? ...Do I have to call them?"	Quick replies not discoverable; mic reads as the only way to respond - **screen 11**
T3	**P**	2:45	0	Read the radar backwards - said north needed photos when north was covered	"Green means... done? Or green means go there?"	Radar legend ambiguous; colour meaning not self-evident - **screen 14**
T4	**C**	1:55	0	-	"I'd definitely turn the location off, that's at my uni."	-
T5	**F**	5:00	1	Looked in Settings, then the host panel	"I'd probably just tell them in person, to be honest."	No obvious route to flag someone mid-session - **screen 14a**

Debrief answers:

- *Most confusing moment:* "The coloured dots. I couldn't tell if I was supposed to go to the green

ones or avoid them."

- *Would join with strangers? why:* "At a uni, yeah. In a random suburb at night, no. Depends who

else is there, and I'd want to see that they're real people."

- *Voice or quick replies:* "Quick replies, a hundred percent. I'm not talking to four strangers."
- *Would change:* "Make the flag thing obvious. And tell me what the colours mean without me having

to guess."

Note-taker's top 3 problems from this session:

1. Radar colour semantics are ambiguous - participant inverted the meaning (screen 14)
2. Quick replies not discoverable; mic appears to be the only response channel (screen 11)
3. Flagging a participant is not findable under time pressure (screen 14a)

Sample B - questionnaire response (remote)

```
Participant code: PQ–1      Device: phone      Time taken: about 12 minutes
Tasks not completed: Task 5 – couldn't find how to report someone
```

Part A - usability scale. Ratings 1-5 across the ten standard statements, giving a computed score of **67.5** for this participant.

How that was worked out: odd-numbered statements score rating – 1, even-numbered score 5 – rating, sum the ten, multiply by 2.5. Lowest-scoring items for this person were the two about complexity and needing to learn a lot before getting going.

Part B - ChronoMap items (1 = strongly disagree, 5 = strongly agree):

Item		Rating
C1	Understood the purpose before doing anything	3
C2	Would join a session with people I don't know	4
C3	Would be comfortable on the voice channel	**2**
C4	Radar made it clear where to stand	**2**
C5	Trusted faces and location would be protected	4
C6	Model and badge would make me take part again	3

Part C - open questions:

> **O1. Most confusing moment, and on which screen?**
> "The radar screen during filming. I understood there were gaps but not which gap was mine to
> fill. I ended up just taking photos where I already was."

> **O2. What would stop you using this at a real landmark?**
> "Honestly, standing around with strangers for five minutes feels awkward unless someone's clearly
> in charge. The host thing helps but I wasn't sure if the host was a real person or the app."

Sample C - how those roll up into a finding

Two participants above hit the same problem in different ways. That becomes **one row**, not two:

ID	Problem	Screen	Task	Evidence	Participants	Severity	Decision
F1	Radar colour coding is ambiguous: participants cannot tell whether a colour marks a covered area or one needing coverage	14	T3	PT-1 inverted the meaning out loud ("green means done? or green means go there?"); Q1 rated radar clarity 2 and said they "didn't know which gap was mine"	PT-1, Q1	**3 - major**	**Fix:** add an explicit legend and change the thin-area marker from a hollow dot to a labelled chip

Why severity 3: it did not stop the task being completed, but it defeats the core coordination idea. If people cannot read the radar, the whole argument that the design makes a group behave like a camera array falls over.

Things this sample illustrates

- **Merge, don't duplicate.** The same underlying problem seen by several people is one finding

with several participant codes, and that count is what makes it credible.

- **Evidence means a quote or an observed action**, not "users found it confusing."
- **Severity is about consequence**, not how loudly someone complained.
- **Not everything becomes a fix.** PT-1's "I'd just tell them in person" is a real reaction but may

be a *defer* - a prototype cannot test social dynamics that need real co-presence. Say so, with the reason. A deferral with an honest justification reads better than a silent omission.

- **A score near the published average of ~68 is not a result on its own.** Five people cannot

support a statistical claim. Report it as a reference point, and let the qualitative findings do the real work.
